No single approach can fully eliminate the risk of healthcare-associated infections (HAIs).

That’s why hospitals need multiple layers of defense—an approach known as “layering” or “bundling,” which combines:

1. Compliance monitoring and feedback
2. Staff education
3. Choosing appropriate disinfection products
4. Establishing standardized, evidence-based policies & protocols
5. No-touch, whole room decontamination

A combination of UVC technology and highly compliant manual disinfection (i.e., surface disinfection) can help prevent healthcare-associated infections, decreasing the risk of infections among patients in hospital settings.

Reducing HAIs in your healthcare setting can save time, money, and even lives.
